Target Details		
Alternative Name:	DNA2 (DNA2 Products)	
Background:	Description: Key enzyme involved in DNA replication and DNA repair in nucleus and	
	mitochondrion. Involved in Okazaki fragments processing by cleaving long flaps that escape	
	FEN1: flaps that are longer than 27 nucleotides are coated by replication protein A complex	
	(RPA), leading to recruit DNA2 which cleaves the flap until it is too short to bind RPA and	
	becomes a substrate for FEN1. Also involved in 5'-end resection of DNA during double-strand	
	break (DSB) repair: recruited by BLM and mediates the cleavage of 5'-ssDNA, while the 3'-	
	ssDNA cleavage is prevented by the presence of RPA. Also involved in DNA replication	
	checkpoint independently of Okazaki fragments processing. Possesses different enzymatic	
	activities, such as single-stranded DNA (ssDNA)-dependent ATPase, 5'-3' helicase and	
	endonuclease activities. While the ATPase and endonuclease activities are well-defined and	
	play a key role in Okazaki fragments processing and DSB repair, the 5'-3' DNA helicase activity is	
	subject to debate. According to various reports, the helicase activity is weak and its function	
	remains largely unclear. Helicase activity may promote the motion of DNA2 on the flap, helping	
	the nuclease function.
