Alternative Name:	HDAC7 (HDAC7 Products)
Background:	Description: Responsible for the deacetylation of lysine residues on the N-terminal part of the core histones (H2A, H2B, H3 and H4). Histone deacetylation gives a tag for epigenetic
	repression and plays an important role in transcriptional regulation, cell cycle progression and
	developmental events. Histone deacetylases act via the formation of large multiprotein
	complexes. Involved in muscle maturation by repressing transcription of myocyte enhancer
	factors such as MEF2A, MEF2B and MEF2C. During muscle differentiation, it shuttles into the
	cytoplasm, allowing the expression of myocyte enhancer factors (By similarity). May be
	involved in Epstein-Barr virus (EBV) latency, possibly by repressing the viral BZLF1 gene.
	Positively regulates the transcriptional repressor activity of FOXP3 (PubMed:17360565).

Western Blotting

Image 1. Western blot analysis of HDAC7 expression in HUVEC cell extract. The lane on the left is treated with the antigen-specific peptide.

Immunohistochemistry

Image 2. ABIN6269019 at 1/100 staining Mouse brain tissue by IHC-P. The sample was formaldehyde fixed and a heat mediated antigen retrieval step in citrate buffer was performed. The sample was then blocked and incubated with the antibody for 1.5 hours at 22°C. An HRP conjugated goat anti-rabbit antibody was used as the secondary.

Immunofluorescence (fixed cells)

Image 3. ABIN6269019 staining HepG2 by IF/ICC. The sample were fixed with PFA and permeabilized in 0.1% Triton X-100,then blocked in 10% serum for 45 minutes at 25°C. The primary antibody was diluted at 1/200 and incubated with the sample for 1 hour at 37°C. An Alexa Fluor 594 conjugated goat anti-rabbit IgG (H+L) Ab, diluted at 1/600, was used as the secondary antibody.
