Target Details		
Alternative Name:	RAB11A (RAB11A Products)	
Background:	Description: The small GTPases Rab are key regulators of intracellular membrane trafficking,	
	from the formation of transport vesicles to their fusion with membranes. Rabs cycle between	
	an inactive GDP-bound form and an active GTP-bound form that is able to recruit to	
	membranes different set of downstream effectors directly responsible for vesicle formation,	
	movement, tethering and fusion. That Rab regulates endocytic recycling. Acts as a major	
	regulator of membrane delivery during cytokinesis. Together with MYO5B and RAB8A	
	participates in epithelial cell polarization. Together with RAB3IP, RAB8A, the exocyst complex,	
	PARD3, PRKCI, ANXA2, CDC42 and DNMBP promotes transcytosis of PODXL to the apical	
	membrane initiation sites (AMIS), apical surface formation and lumenogenesis. Together with	
	MYO5B participates in CFTR trafficking to the plasma membrane and TF (Transferrin) recycling	
	in nonpolarized cells. Required in a complex with MYO5B and RAB11FIP2 for the transport of	
	NPC1L1 to the plasma membrane. Participates in the sorting and basolateral transport of	
	CDH1 from the Golgi apparatus to the plasma membrane. Regulates the recycling of FCGRT	
	(receptor of Fc region of monomeric Ig G) to basolateral membranes. May also play a role in	
	melanosome transport and release from melanocytes.

#### Immunohistochemistry

**Image 1.** ABIN6276570 at 1/100 staining Mouse lung tissue by IHC-P. The sample was formaldehyde fixed and a heat mediated antigen retrieval step in citrate buffer was performed. The sample was then blocked and incubated with the antibody for 1.5 hours at 22jãC. An HRP conjugated goat anti-rabbit antibody was used as the secondary

### Western Blotting
