Target Details

Target Type:	Antibody
Background:	Secreted as part of the adaptive immune response by plasma B cells, immunoglobulin G
	constitutes 75 % of serum immunoglobulins. Immunoglobulin G binds to viruses, bacteria, as
	well as fungi and facilitates their destruction or neutralization via agglutination (and thereby
	immobilizing them), activation of the compliment cascade, and opsonization for phagocytosis.
	The whole IgG molecule possesses both the F(c) region, recognized by high-affinity Fc receptor
	proteins, as well as the F(ab) region possessing the epitope-recognition site. Both heavy and
	light chains of the antibody molecule are present.

Comment:	Anti-Chicken IgG DyLight649 has been tested by western blot. This product is designed for
	immunofluorescence microscopy, fluorescence based plate assays (FLISA) and fluorescent
	western blotting. This product is also suitable for multiplex analysis, including multicolor
	imaging, utilizing various commercial platforms. The emission spectra for this DyLight $^{ m M}$
	conjugate match the principle output wavelengths of most common fluorescence
	instrumentation.
