Target Details

| Target Type: | Antibody |
|---------------------|--|
| Background: | Secreted as part of the adaptive immune response by plasma B cells, immunoglobulin G |
| | constitutes 75 % of serum immunoglobulins. Immunoglobulin G binds to viruses, bacteria, as |
| | well as fungi and facilitates their destruction or neutralization via agglutination (and thereby |
| | immobilizing them), activation of the compliment cascade, and opsonization for phagocytosis. |
| | The whole IgG molecule possesses both the F(c) region, recognized by high-affinity Fc recepto |
| | proteins, as well as the F(ab) region possessing the epitope-recognition site. Both the Heavy |
| | and Light chains of the antibody molecule are present. Secondary Antibodies are available in a |
| | variety of formats and conjugate types. When choosing a secondary antibody product, |
| | consideration must be given to species and immunoglobulin specificity, conjugate type, |
| | fragment and chain specificity, level of cross-reactivity, and host-species source and fragment |
| | composition. This Anti-Rat IgG is conjugated to DyLight™680. |

| Comment: | Anti-Rat IgG (H&L) DyLight™680 Antibody has been tested by western blot and is designed for |
| | immunofluorescence microscopy, fluorescence based plate assays (FLISA) and fluorescent |
| | western blotting. This product is also suitable for multiplex analysis, including multicolor |
| | imaging, utilizing various commercial platforms. The emission spectra for this DyLight™ |
| | conjugate match the principle output wavelengths of most common fluorescence |
| | instrumentation. |
