Target Details	
Target Type:	Antibody
Background:	Immunoglobulin M is the largest antibody isotype and the first to be secreted against an initial
	exposure to antigen. IgM is predominantly produced in the spleen. Formed from covalently
	linking 5 immunoglobulins together, the approximate molecular weight of IgM is 900 kDa and
	possesses 10 binding sites (though due to the size of most antigens, not all sites are capable of
	binding at once). Due to this large size, IgM is typically isolated to the serum. Anti-Rat IgM

antibody is ideal for investigators in Immunology, Microbiology, and Cell Biology. This Rat IgM Antibody is conjugated to DyLight™800.

Comment:	This product is designed for immunofluorescence microscopy, fluorescence based plate
	assays (FLISA) and fluorescent western blotting. This product is also suitable for multiplex
	analysis, including multicolor imaging, utilizing various commercial platforms. The emission
	spectra for this DyLight $^{\scriptscriptstyle M}$ conjugate match the principle output wavelengths of most common
	fluorescence instrumentation.
