	Background: Cystatin B(CSTB), also called STFB, is a small protein that is a member of the	
	superfamily of cysteine protease inhibitors. It has been isolated from human spleen and liver	
	and its amino acid sequence has been fully determined. The cystatin B gene is located on	
	21q22.3. It is widely distributed and is localized mostly intracellularly, but has been found	
	extracellularly. The protein is able to form a dimer stabilized by noncovalent forces, inhibiting	
	papain and cathepsins I, h and b. Its role is thought to be as a protector against the proteinases

function, and that the loss of this function might contribute to the etiopathogenesis of EPM1.
Upon differentiation to myotubes, CSTB becomes excluded from the nucleus and lysosomes,
suggesting that the subcellular distribution of CSTB is dependent on the differentiation status
of the cell.

	0.1 mL per well of the 4000pg/mL, 2000pg/mL, 1000pg/mL, 500pg/mL, 250pg/mL, 125pg/mL,
	62.5pg/mL human Cystatin B standard solutions into the precoated 96-well plate. Add 0.1 mL
	of the sample diluent buffer into the control well (Zero well). Add 0.1 mL of each properly
	diluted sample of human cell culture supernates, serum, plasma(heparin, EDTA), saliva, urine or
	human milk to each empty well. We recommend that each human Cystatin B standard solution
	and each sample is measured in duplicate.
