during prenatal development and its gene activity is regulated by genomic imprinting, in that the
allele inherited from the father is active and the allele inherited from the mother is inactive in
most normal tissues. IGF-II appears to be induced by placental lactogen during prenatal
development. It is a mediator of prolactin-induced alveologenesis, prolactin, IGF-2, and cyclin
D1, all of which are overexpressed in breast cancers, are components of a developmental
pathway in the mammary gland.
