	Background: ITAGV encodes integrin alpha chain V. Integrins are heterodimeric integral		
	membrane proteins composed of an alpha chain and a beta chain. The I-domain containin		
	integrin alpha V undergoes post-translational cleavage to yield disulfide-linked heavy and light		
	chains, that combine with multiple integrin beta chains to form different integrins. Among the		
	known associating beta chains (beta chains 1,3,5,6, and 8, 'ITGB1', 'ITGB3', 'ITGB5', 'ITGB6', and		
	'ITGB8'), each can interact with extracellular matrix ligands, the alpha V beta 3 integrin, perhaps		
	the most studied of these, is referred to as the Vitronectin receptor (VNR). In addition to		
	adhesion, many integrins are known to facilitate signal transduction. The ITGB3 protein product		
	is the integrin beta chain beta 3. Integrins are integral cell-surface proteins composed of an		
	alpha chain and a beta chain. A given chain may combine with multiple partners resulting in		
	different integrins. Integrin beta 3 is found along with the alpha IIb chain in platelets. Integrins		
	are known to participate in cell adhesion as well as cell-surface mediated signalling.
