	Background: ITAGV encodes integrin alpha chain V. Integrins are heterodimeric integral
	membrane proteins composed of an alpha chain and a beta chain. The I-domain containing
	integrin alpha V undergoes post-translational cleavage to yield disulfide-linked heavy and light
	chains, that combine with multiple integrin beta chains to form different integrins. Among the
	known associating beta chains (beta chains 1,3,5,6, and 8, 'ITGB1', 'ITGB3', 'ITGB5', 'ITGB6', and
	'ITGB8'), each can interact with extracellular matrix ligands, the alpha V beta 3 integrin, perhaps
	the most studied of these, is referred to as the Vitronectin receptor (VNR). In addition to
	adhesion, many integrins are known to facilitate signal transduction. The ITGB3 protein product
	is the integrin beta chain beta 3. Integrins are integral cell-surface proteins composed of an
	alpha chain and a beta chain. A given chain may combine with multiple partners resulting in
	different integrins. Integrin beta 3 is found along with the alpha IIb chain in platelets. Integrins
	are known to participate in cell adhesion as well as cell-surface mediated signalling.
