| containing 2, Ankyrin repeat and SOCS box containing protein 2, Ankyrin repeat containing         |
|---|
| protein ASB2.ASB2_HUMAN   |
| Background: The ankyrin repeat and SOCS box containing (ASB) protein family is comprised of       |
| members which each contain "SOCS boxes" but differ from other families of protein in the          |
| motifs they contain upstream of the SOCS box. SOCS boxes are carboxy terminal regions of          |
| homology found in the suppressor of cytokine signaling family of proteins. The box region is      |
| thought to be the point of interaction between SOCS proteins and E3 ubiquitin ligases. The        |
| SOCS box serves to couple suppressor of cytokine signalling (SOCS) proteins and their binding     |
| partners with the elongin B and C complex, possibly targeting them for degradation. The gene is   |
| induced by all trans retinoic acid. In myeloid leukemia cells, the expression of this encoded     |
| protein has been shown to induce growth inhibition and chromatin condensation. Multiple           |
| alternatively spliced transcript variants have been described for this gene but their full length |
| sequences are not known.  |
