	Background: ARHGEF7 is a p21-activated protein kinase (Pak)-interacting exchange factor that	
	has been identified as a putative guanine nucleotide exchange factor (GEF) for Rac/Cdc42. It is	
	expressed ubiquitously in all the tissue examined and other isoforms are expressed mainly in	
	the central nervous system. Regulated phosphorylation of ARHGEF7 is necessary to maintain	
	the balance between normal signalling by EGFR and Src versus aberrant growth and	
	transformation.Multiple alternatively spliced transcript variants encoding different isoforms	
	have been described for this gene, but some of their full-length sequences have not been	
	determined.	
Gene ID:	8874	
Pathways:	EGFR Signaling Pathway, Neurotrophin Signaling Pathway, EGFR Downregulation
