#### Product Details

Immunogen:	Human MAGE-A1 full length recombinant protein
Clone:	SPM282
lsotype:	IgG1 kappa
Specificity:	Recognizes a protein of 42-46 kDa, identified as MAGE-1. This MAb does not cross-react with
	MAGE-2, -3, -4, -6 -9, -10, -or -12 protein. Human malignant neoplasms carry rejection antigens
	that are recognized by the patients' autologous, tumor directed and specific, cytolytic, CD8+ T $$
	lymphocyte clones (CTL). The MAGE family of genes codes an important group of antigens. It
	was identified that melanomas and primary glial brain tumors express common melanoma
	associated antigens (MAAs). Because MAGE-1 is expressed on a significant proportion of
	human neoplasms of various histological types (melanoma, brain tumors of glial origin,
	neuroblastoma, non-small cell lung cancer, breast, gastric, colorectal, ovarian, renal cell
	carcinomas) and not on normal tissues, the encoded antigen may serve as a marker of early
