## Product Details

Immunogen:	Recombinant full-length human Moesin protein
Clone:	MSN-493
Isotype:	IgG1 kappa
Specificity:	Recognizes 78 kDa moesin protein. Moesin, a member of the talin-4.1 superfamily, is a linking
	protein of the sub-membranous actin cytoskeleton. It is expressed in variable amounts in cells
	of different phenotypes such as macrophages, lymphocytes, fibroblastic, endothelial, epithelial,
	and neuronal cell lines but not in blood cells. The ERM proteins, ezrin, radixin, and moesin are
	involved in a variety of cellular functions, such as cell adhesion, migration, and the organization
	of cell surface structures, and are highly homologous, both in protein sequence and in
	functional activity, with merlin/schwannomin, a neurofibromatosis-2-associated tumor-
	suppressor protein. Cell lines of epithelial and mesothelial origin contain both moesin and
	radixin whereas cells of endothelial and lymphoid origin express moesin.
