## Product Details

Immunogen:	Recombinant human PHB protein fragment (aa167-261) (exact sequence is proprietary)
Clone:	PHB-1881
lsotype:	lgG2c kappa
Specificity:	Recognizes a protein of 30 kDa which is identified as Prohibitin, an evolutionarily conserved
	protein with homologues found in yeast to man. It is located in the inner membrane of
	mitochondria. Although prohibitin mRNA and protein expression occurs throughout the cell
	cycle, maximum levels are detected during the G1/S phase transition and minimum levels are
	seen in S phase and the G2/mitosis boundary. Prohibitin is located exclusively in the
	mitochondria with the highest concentration on the inner membrane. Prohibitin is an ideal
	mitochondrial marker. It shows antiproliferative activity and has been proposed to play a role in
	normal cell cycle regulation, replicative senescence, cellular immortalization, and tumor
