ACTH (same as Corticotropin) is a 39 amino acid active peptide produced by the anterior
pituitary. This MAb is specific to Synacthen (aa1-24 of ACTH), does not react with CLIP (aa17-
39 of ACTH). POMC (pro-opiomelanocortin or corticotropin-lipotropin) is a 267 amino acid
polypeptide hormone precursor that goes through extensive, tissue-specific posttranslational
processing by convertases. POMC is cleaved into ten hormone chains named NPP, ACTH,
alpha-MSH (Melanocyte Stimulating Hormone), beta-MSH, gamma-MSH, CLIP (corticotropin-

like intermediary peptide), Lipotropin-beta, Lipotropin-gamma, beta-endorphin and Met-

	enkephalin. ACTH is also produced by cells of immune system (T-cells, B-cells, and
	macrophages) in response to stimuli associated with stress. Anti-ACTH is a useful marker in
	classification of pituitary tumors and the study of pituitary disease. It reacts with ACTH-
	producing cells (corticotrophs).It also may react with other tumors (e.g. some small cell
	carcinomas of the lung) causing paraneoplastic syndromes by secreting ACTH. '
Cross-Reactivity (Details):	Expected to show a broad species reactivity.
Purification:	Purified by Protein A/G
