	by and processed within the thyroid gland to produce the hormone thyroxine and
	triiodothyronine. Prior to forming dimers, thyroglobulin monomers undergo conformational
	maturation in the endoplasmic reticulation. The vast majority of follicular carcinomas of the
	thyroid will give positive immunoreactivity for anti-thyroglobulin even though sometimes only
	focally. Poorly differentiated carcinomas of the thyroid are frequently anti-thyroglobulin
	negative. Adenocarcinomas of other-than-thyroid origin do not react with this antibody. This
	antibody is useful in identification of thyroid carcinoma of the papillary and follicular types.
	Presence of thyroglobulin in metastatic lesions establishes the thyroid origin of tumor. Anti-
	thyroglobulin, combined with anti-calcitonin, can identify medullary carcinomas of the thyroid.
	Furthermore, anti-thyroglobulin, combined with anti-TTF1, can be a reliable marker to
	differentiate between primary thyroid and lung neoplasms.
