Synonyms: COX VIa L, COX VIa-L, COX6A, COX6A1, COX6AL, CX6A1\_HUMAN, Cytochrome c oxidase polypeptide VIa liver, Cytochrome c oxidase polypeptide VIa-liver, Cytochrome c oxidase subunit 6A1, Cytochrome c oxidase subunit 6A1 mitochondrial, Cytochrome C oxidase subunit VIa homolog, Cytochrome c oxidase subunit VIA liver, Cytochrome c oxidase subunit VIa polypeptide 1, Cytochrome c oxidase subunit VIA-liver, MGC104500, mitochondrial. Background: Cytochrome c oxidase (COX), the terminal enzyme of the mitochondrial respiratory chain, catalyzes the electron transfer from reduced cytochrome c to oxygen. It is a heteromeric complex consisting of 3 catalytic subunits encoded by mitochondrial genes and multiple structural subunits encoded by nuclear genes. The mitochondrially-encoded subunits function in the electron transfer and the nuclear-encoded subunits may function in the regulation and assembly of the complex. This nuclear gene encodes polypeptide 1 (liver isoform) of subunit VIa, and polypeptide 1 is found in all non-muscle tissues. Polypeptide 2 (heart/muscle isoform) of subunit VIa is encoded by a different gene, and is present only in striated muscles. These two polypeptides share 66 % amino acid sequence identity. It has been reported that there may be several pseudogenes on chromosomes 1, 6, 7q21, 7q31-32 and 12. However, only one pseudogene (COX6A1P) on chromosome 1p31.1 has been documented.
