|-------------|--|
| | thiouridylase subunit 2 homolog (S. pombe), NCS2, PF0432. |
| | Background: CTU2 is a 515 amino acid cytoplasmic protein that plays a role in the 2-thiolation |
| | of mcm(5)S(2)U at wobble positions of tRNA. CTU2 forms a complex with CTU1 and Urm1, and |
| | may also form a separate heterodimer with CTU1 to ligate sulfur from thiocarboxylated Urm1 |
| | onto tRNA. Existing as three alternatively spliced isoforms, the gene encoding CTU2 maps to |
| | human chromosome 16q24.3. Chromosome 16 encodes over 900 genes and comprises nearly |
| | 3 % of the human genome. The GAN gene is located on chromosome 16 and, with mutation, |
| | may lead to giant axonal neuropathy, a nervous system disorder characterized by increasing |
| | malfunction with growth. The rare disorder Rubinstein-Taybi syndrome is also associated with |
| | chromosome 16, as is Crohn's disease, which is a gastrointestinal inflammatory condition. |
| Gene ID: | 348180 |
| UniProt: | Q2VPK5 |
