| | Background: Diacylglycerol kinases (DGKs) are regulators of the intracellular concentration of | |
| | the second messenger diacylglycerol (DAG) and thus play a key role in cellular processes. Nine | |
| | mammalian isotypes have been identified, which are encoded by separate genes. Mammalian | |
| | DGK isozymes contain a conserved catalytic (kinase) domain and a cysteine-rich domain | |
| | (CRD). The protein encoded by this gene is a diacylglycerol kinase, beta isotype. Two | |
| | alternatively spliced transcript variants have been found for this gene. [provided by RefSeq, Jul | |
