| | Background: This gene encodes a member of the DEAD box protein family. The DEAD box | | |
| | proteins are characterized by the conserved motif Asp-Glu-Ala-Asp (DEAD), are putative RNA | | |
| | helicases. They are implicated in a number of cellular processes involving alteration of RNA | | |
| | secondary structure such as translation initiation, nuclear and mitochondrial splicing, and | | |
| | ribosome and spliceosome assembly. Based on their distribution patterns, some members of | | |
| | this DEAD box protein family are believed to be involved in embryogenesis, spermatogenesis, | | |
| | and cellular growth and division. Alternative splicing results in multiple transcript variants. | | |
