| | Background: DNASE1L2 is a 299 amino acid secreted protein that is expressed in brain tissue | |
| | and shares sequence similarity with DNase I, suggesting a possibly role in DNA hydrolysis. The | |
| | gene encoding DNASE1L2 maps to human chromosome 16, which encodes over 900 genes | |
| | and comprises nearly 3 $\%$ of the human genome. The GAN gene is located on chromosome 16 | |
| | and, with mutation, may lead to giant axonal neuropathy, a nervous system disorder | |
| | characterized by increasing malfunction with growth. The rare disorder Rubinstein-Taybi | |
| | syndrome is also associated with chromosome 16, as is Crohn's disease, which is a | |
| | gastrointestinal inflammatory condition. | |
