Background:	Synonyms: EFSEC, SELB_HUMAN_ Elongation factor for selenoprotein translation, Elongation	
	factor sec, Eukaryotic elongation factor, selenocysteine tRNA specific, SELB, Selenocysteine	
	specific elongation factor.	
	Background: EEFSEC is a 596 amino acid protein that localizes to both the nucleus and the	
	cytoplasm and belongs to the GTP-binding elongation factor family. Functioning as a	
	translation factor, SELB binds GTP and GDP and is necessary for the incorporation of	
	selenocysteine into target proteins. The gene encoding SELB maps to human chromosome 3	
	which houses over 1,100 genes, including a chemokine receptor (CKR) gene cluster and a	
	variety of human cancer-related gene loci. Key tumor suppressing genes on chromosome 3	
	include those that encode the apoptosis mediator RASSF1, the cell migration regulator HYAL $$	
	and the angiogenesis suppressor SEMA3B. Marfan Syndrome, porphyria, von Hippel-Lindau	
	syndrome, osteogenesis imperfecta and Charcot-Marie-Tooth Disease are a few of the	
	numerous genetic diseases associated with chromosome 3.
