Background:	Synonyms: EFSEC, SELB_HUMAN_ Elongation factor for selenoprotein translation, Elongation	
Buckground.	factor sec, Eukaryotic elongation factor, selenocysteine tRNA specific, SELB, Selenocysteine	
	specific elongation factor.	
	Background: EEFSEC is a 596 amino acid protein that localizes to both the nucleus and the	
	cytoplasm and belongs to the GTP-binding elongation factor family. Functioning as a	
	translation factor, SELB binds GTP and GDP and is necessary for the incorporation of	
	selenocysteine into target proteins. The gene encoding SELB maps to human chromosome 3,	
	which houses over 1,100 genes, including a chemokine receptor (CKR) gene cluster and a	
	variety of human cancer-related gene loci. Key tumor suppressing genes on chromosome 3	
	include those that encode the apoptosis mediator RASSF1, the cell migration regulator HYAL1	
	and the angiogenesis suppressor SEMA3B. Marfan Syndrome, porphyria, von Hippel-Lindau	
	syndrome, osteogenesis imperfecta and Charcot-Marie-Tooth Disease are a few of the	
	numerous genetic diseases associated with chromosome 3.
