	Background: This gene encodes a member of the immunoglobulin receptor superfamily and is	
	one of several Fc receptor-like glycoproteins clustered on the long arm of chromosome 1. The	
	encoded protein contains three extracellular C2-like immunoglobulin domains, a	
	transmembrane domain and a cytoplasmic domain with two immunoreceptor-tyrosine	
	activation motifs. This protein may play a role in the regulation of cancer cell growth. Alternative	
	splicing results in multiple transcript variants. [provided by RefSeq, Apr 2009]
