alpha preproprotein, Fibrinogen alpha/alpha E chain [Precursor], fibrinogen alpha chain isoform	
alpha-E preproprotein, fibrinogen alpha chain isoform alpha preproprotein.	
Background: The protein encoded by this gene is the alpha component of fibrinogen, a blood-	
borne glycoprotein comprised of three pairs of nonidentical polypeptide chains. Following	
vascular injury, fibrinogen is cleaved by thrombin to form fibrin which is the most abundant	
component of blood clots. In addition, various cleavage products of fibrinogen and fibrin	
regulate cell adhesion and spreading, display vasoconstrictor and chemotactic activities, and	
are mitogens for several cell types. Mutations in this gene lead to several disorders, including	
dysfibrinogenemia, hypofibrinogenemia, afibrinogenemia and renal amyloidosis. Alternative	
splicing results in two isoforms which vary in the carboxy-terminus. [provided by RefSeq, Jul
