Background:	Synonyms: FGA, Fib2, FIBA_HUMAN, Fibrinogen alpha chain, fibrinogen alpha chain isoform

Target Details

alpha preproprotein, Fibrinogen alpha/alpha E chain [Precursor], fibrinogen alpha chain isoform alpha-E preproprotein, fibrinogen alpha chain isoform alpha preproprotein.

Background: The protein encoded by this gene is the alpha component of fibrinogen, a blood-borne glycoprotein comprised of three pairs of nonidentical polypeptide chains. Following vascular injury, fibrinogen is cleaved by thrombin to form fibrin which is the most abundant component of blood clots. In addition, various cleavage products of fibrinogen and fibrin regulate cell adhesion and spreading, display vasoconstrictor and chemotactic activities, and are mitogens for several cell types. Mutations in this gene lead to several disorders, including dysfibrinogenemia, hypofibrinogenemia, afibrinogenemia and renal amyloidosis. Alternative splicing results in two isoforms which vary in the carboxy-terminus. [provided by RefSeq, Jul 2008]
