| alpha preproprotein, Fibrinogen alpha/alpha E chain [Precursor], fibrinogen alpha chain isoform |
|--|
| alpha-E preproprotein, fibrinogen alpha chain isoform alpha preproprotein. |
| Background: The protein encoded by this gene is the alpha component of fibrinogen, a blood- |
| borne glycoprotein comprised of three pairs of nonidentical polypeptide chains. Following |
| vascular injury, fibrinogen is cleaved by thrombin to form fibrin which is the most abundant |
| component of blood clots. In addition, various cleavage products of fibrinogen and fibrin |
| regulate cell adhesion and spreading, display vasoconstrictor and chemotactic activities, and |
| are mitogens for several cell types. Mutations in this gene lead to several disorders, including |
| dysfibrinogenemia, hypofibrinogenemia, afibrinogenemia and renal amyloidosis. Alternative |
| splicing results in two isoforms which vary in the carboxy-terminus. [provided by RefSeq, Jul |
