Alternative Name:	hnRNP M (HNRNPM Products)		
Background:	Synonyms: CEA receptor, CEAR, Heterogeneous nuclear ribonucleoprotein M, Heterogenous		
	nuclear ribonucleoprotein M4, hnRNA binding protein M4, hnRNP M, Hnrnpm, HNRNPM4,		
	HNRPM, HNRPM_HUMAN, HNRPM4, HTGR1, M3 antibody M4 antibody M4 protein, N-		
	acetylglucosamine receptor 1, NAGR1, Ribonucleotide Protein, SAF A.		
	Background: This gene belongs to the subfamily of ubiquitously expressed heterogeneous		
	nuclear ribonucleoproteins (hnRNPs). The hnRNPs are RNA binding proteins and they complex		
	with heterogeneous nuclear RNA (hnRNA). These proteins are associated with pre-mRNAs in		
	the nucleus and appear to influence pre-mRNA processing and other aspects of mRNA		
	metabolism and transport. While all of the hnRNPs are present in the nucleus, some seem to		
	shuttle between the nucleus and the cytoplasm. The hnRNP proteins have distinct nucleic acid		
	binding properties. The protein encoded by this gene has three repeats of quasi-RRM domains		
	that bind to RNAs. This protein also constitutes a monomer of the N-acetylglucosamine-		
	specific receptor which is postulated to trigger selective recycling of immature GlcNAc-bearing		
	thyroglobulin molecules. Alternative splicing results in multiple transcript variants. [provided by
