Background:	Synonyms: Differentially expressed in normal and neoplastic cells, FLJ35600, IG20, Insulinoma
	glucagonoma clone 20, KIAA0358, MADD, MADD_HUMAN, MAP kinase-activating death
	domain protein, Rab3 GDP/GTP exchange factor, RAB3GEP, DENN
	Background: Tumor necrosis factor alpha (TNF-alpha) is a signaling molecule that interacts
	with one of two receptors on cells targeted for apoptosis. The apoptotic signal is transduced
	inside these cells by cytoplasmic adaptor proteins. The protein encoded by this gene is a death
	domain-containing adaptor protein that interacts with the death domain of TNF-alpha receptor
	1 to activate mitogen-activated protein kinase (MAPK) and propagate the apoptotic signal. It is
	membrane-bound and expressed at a higher level in neoplastic cells than in normal cells.
	Several transcript variants encoding different isoforms have been described for this gene.
