	Background: This gene encodes a member of the protein kinase C (PKC) family of
	serine/threonine protein kinases. The PKC family comprises at least eight members, which are
	differentially expressed and are involved in a wide variety of cellular processes. This protein
	kinase is calcium-independent and phospholipid-dependent. It is not activated by phorbolesters
	or diacylglycerol. This kinase can be recruited to vesicle tubular clusters (VTCs) by direct
	interaction with the small GTPase RAB2, where this kinase phosphorylates glyceraldehyde-3-
	phosphate dehydrogenase (GAPD/GAPDH) and plays a role in microtubule dynamics in the
	early secretory pathway. This kinase is found to be necessary for BCL-ABL-mediated resistance
	to drug-induced apoptosis and therefore protects leukemia cells against drug-induced
	apoptosis. There is a single exon pseudogene mapped on chromosome X. [provided by RefSeq,
