|                     | Background: Vesicle mediated protein sorting plays an important role in segregation of           |
|                     | intracellular molecules into distinct organelles. Genetic studies in yeast have identified more  |
|                     | than 40 vacuolar protein sorting (VPS) genes involved in vesicle transport to vacuoles. This     |
|                     | gene is a member of the Sec-1 domain family, and encodes the human ortholog of rat Vps33b        |
|                     | which is homologous to the yeast class C Vps33 protein. The mammalian class C vacuolar           |
|                     | protein sorting proteins are predominantly associated with late endosomes/lysosomes, and like    |
|                     | their yeast counterparts, may mediate vesicle trafficking steps in the endosome/lysosome         |
|                     | pathway. Mutations in this gene are associated with arthrogryposis-renal dysfunction-            |
|                     | cholestasis syndrome. Alternative splicing results in multiple transcript variants. [provided by |
