| | Background: Vesicle mediated protein sorting plays an important role in segregation of | |
| | intracellular molecules into distinct organelles. Genetic studies in yeast have identified more | |
| | than 40 vacuolar protein sorting (VPS) genes involved in vesicle transport to vacuoles. This | |
| | gene is a member of the Sec-1 domain family, and encodes the human ortholog of rat Vps33b | |
| | which is homologous to the yeast class C Vps33 protein. The mammalian class C vacuolar | |
| | protein sorting proteins are predominantly associated with late endosomes/lysosomes, and like | |
| | their yeast counterparts, may mediate vesicle trafficking steps in the endosome/lysosome | |
| | pathway. Mutations in this gene are associated with arthrogryposis-renal dysfunction- | |
| | cholestasis syndrome. Alternative splicing results in multiple transcript variants. [provided by | |
