## Target Details

Target Details	
Target:	Histone 3 (H3)
Alternative Name:	Histone 3 (H3 Products)
Background:	Histones are the main constituents of the protein part of chromosomes of eukaryotic cells.
	They are rich in the amino acids arginine and lysine and have been greatly conserved during
	evolution. Histones pack the DNA into tight masses of chromatin. Two core histones of each
	class H2A, H2B, H3 and H4 assemble and are wrapped by 146 base pairs of DNA to form one
	octameric nucleosome. Histone tails undergo numerous post-translational modifications,
	which either directly or indirectly alter chromatin structure to facilitate transcriptional activation
	or repression or other nuclear processes. In addition to the genetic code, combinations of the
	different histone modifications reveal the so-called "histone code". Histone methylation and
	demethylation is dynamically regulated by respectively histone methyl transferases and histone
	demethylases. Acetylation of histone H3K27 is associated with active promoters and
	enhancers.
