## Overview

| Quantity: | 96 tests |
| :--- | :--- |
| Target: | Cathepsin L (CTSL1) |
| Reactivity: | Mouse |
| Method Type: | Sandwich ELISA |
| Detection Range: | $31.25 \mathrm{pg} / \mathrm{mL}-2000 \mathrm{pg} / \mathrm{mL}$ |
| Minimum Detection Limit: | $31.25 \mathrm{pg} / \mathrm{mL}$ |
| Application: | ELISA |

Product Details

| Purpose: | The kit is a sandwich enzyme immunoassay technique for the in vitro quantitative |
| :--- | :--- |
|  | measurement in various sample types. |
| Sample Type: | Cell Culture Supernatant, Plasma, Serum |
| Analytical Method: | Quantitative |
| Detection Method: | Colorimetric |
| Specificity: | This kit recognizes Mouse CTSL in samples. No Significant cross-reactivity or interference |
|  | between Mouse CTSL and analogues was observed. |
| Sensitivity: | 18.75 pg/mL <br> Components: |
|  | - Pre-coated, ready to use 96 -well strip plate, flat buttom |
|  | - Reference Standard |
|  | - Reference Standard \& Sample Diluent |

- Biotinylated Detection Antibody (100 x concentrate)
- HRP Conjugate ( $100 \times$ concentrate)
- Biotinylated Detection Antibody Diluent
- HRP Conjugate Diluent
- Substrate Reagent
- Stop Solution
- Wash Buffer ( $25 \times$ concentrate)
- Instruction manual

Target Details

| Target: | Cathepsin L(CTSL1) |
| :--- | :--- |
| Alternative Name: | Cathepsin L(CTSL1 Products) |
| Background: | CTSL1, CATL, MEP |
| Pathways: | Activation of Innate immune Response, Toll-Like Receptors Cascades |

## Application Details

| Sample Volume: | $100 \mu \mathrm{~L}$ |
| :---: | :---: |
| Assay Time: | 3.5 h |
| Plate: | Pre-coated |
| Protocol: | 1. Add $100 \mu \mathrm{~L}$ standard or sample to each well. Incubate for 90 min at $37^{\circ} \mathrm{C}$. <br> 2. Remove the liquid. Add $100 \mu \mathrm{~L}$ Biotinylated Detection Antibody. Incubate for 1 hour at $37^{\circ} \mathrm{C}$. <br> 3. Aspirate and wash 3 times. <br> 4. Add $100 \mu \mathrm{~L}$ HRP Conjugate. Incubate for 30 min at $37^{\circ} \mathrm{C}$. <br> 5. Aspirate and wash 5 times. <br> 6. Add $90 \mu \mathrm{~L}$ Substrate Reagent. Incubate for 15 min at $37^{\circ} \mathrm{C}$. <br> 7. Add $50 \mu \mathrm{~L}$ Stop Solution. Read at 450 nm immediately. <br> 8. Calculation of results. |
| Reagent Preparation: | 1. Bring all reagents to room temperature $\left(18 \sim 25^{\circ} \mathrm{C}\right)$ before use. Follow the Microplate reader manual for set-up and preheat it for 15 min before OD measurement. <br> 2. Wash Buffer: Dilute 30 mL of Concentrated Wash Buffer with 720 mL of deionized or distilled water to prepare 750 mL of Wash Buffer. Note: if crystals have formed in the concentrate, warm it in a $40^{\circ} \mathrm{C}$ water bath and mix it gently until the crystals have completely dissolved <br> 3. Standard working solution: Centrifuge the standard at $10,000 \mathrm{xg}$ for 1 min . Add 1.0 mL of Reference Standard \&Sample Diluent, let it stand for 10 min and invert it gently several times. After it dissolves fully, mix it thoroughly with a pipette. This reconstitution produces a working solution of $2000 \mathrm{pg} / \mathrm{mL}$. Then make serial dilutions as needed. The recommended |

dilution gradient is as follows: 2000, 1000, 500, 250, 125, 62.5, 31.25, 0 pg/mL. Dilution method: Take 7 EP tubes, add $500 \mu$ Lof Reference Standard \& Sample Diluent to each tube. Pipette $500 \mu$ Lof the $2000 \mathrm{pg} / \mathrm{mL}$ working solution to the first tube and mix up to produce a $1000 \mathrm{pg} / \mathrm{mL}$ working solution. Pipette $500 \mu$ Lof the solution from the former tube into the latter one according to these steps. The illustration below is for reference. Note: the last tube is regarded as a blank. Don't pipette solution into it from the former tube.
4. Biotinylated Detection Antibody working solution: Calculate the required amount before the experiment ( $100 \mu \mathrm{~L} /$ well). In preparation, slightly more than calculated should be prepared. Centrifuge the stock tube before use, dilute the 100x Concentrated Biotinylated Detection Antibody to 1xworking solution with Biotinylated Detection Antibody Diluent.
5. Concentrated HRP Conjugate working solution: Calculate the required amount before the experiment ( $100 \mu \mathrm{~L} /$ well). In preparation, slightly more than calculated should be prepared. Dilute the 100x Concentrated HRP Conjugate to $1 \times$ working solution with Concentrated HRP Conjugate Diluent.

Sample Preparation:

- It is recommended to use fresh samples without long storage, otherwise protein degradation and denaturationmay occur in these samples, leading to false results. Samples should therefore be stored for a short periodat $2-8^{\circ} \mathrm{C}$ or aliquoted at $-20^{\circ} \mathrm{C}\left(\leq 1\right.$ month) or $-80^{\circ} \mathrm{C}(\leq$ 3 months). Repeated freeze-thawcycles should be avoided. Prior to assay, the frozen samples should be slowly thawed and centrifuged toremove precipitates.
- If the sample type is not specified in the instructions, a preliminary test is necessary to determinecompatibility with the kit.
- If a lysis buffer is used to prepare tissue homogenates or cell culture supernatant, there is a possibilityof causing a deviation due to the introduced chemical substance. The recommended dilution factor is for reference only.
- Please estimate the concentration of the samples before performing the test. If the values are not in therange of the standard curve, the optimal sample dilution for the particular experiment has to be determined. Samples should then be diluted with PBS ( $\mathrm{pH}=7.0-7.2$ ).

Intra-assay Precision (Precision within an assay): 3 samples with low, mid range and high level Mouse CTSL were tested 20 times on one plate, respectively. Inter-assay Precision (Precision between assays): 3 samples with low, mid range and high level Mouse CTSL were tested on 3 different plates, 20 replicates in each plate.

Both intra-CV and inter-CV are < $10 \%$.
Restrictions: For Research Use only

## Handling

## Storage:

Storage Comment:
$4^{\circ} \mathrm{C},-20^{\circ} \mathrm{C}$

1. For unopened kit: All reagents should be stored according to the labels on the vials, so they are stable up to 6 months after receipt of the kit. The Reference Standard, Biotinylated

Detection Antibody, HRP Conjugate and the 96 -well stripe plate should be stored at $-20^{\circ} \mathrm{C}$ upon receipt while the other reagents should be stored at $4^{\circ} \mathrm{C}$.
2. For used kit: When the kit is used, the remaining reagents need to be stored according to the above storage condition. Besides, please return the unused wells to the foil pouch containing the desiccant pack, and zip-seal the foil pouch.

Expiry Date:

## 6 months
