#### Application Notes:

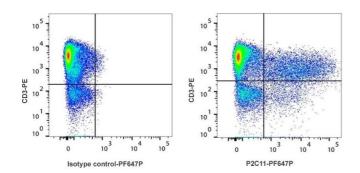

Detection of IFN- $\gamma$  producing cells by flow cytometry. 5  $\mu$ L is recommended for staining of 1 million cells in a total volume of 50  $\mu$ L. Detection of IFN- $\gamma$  by flow cytometry in viable porcine PBMC. Cells were stimulated for 16 hours in the presence of PMA/ionomycin and Brefeldin A. Cells were then fixed and permeabilized using 4 % paraformaldehyde and saponin, and subsequently stained with CD3-PE and P2C11-PF647P (right panel). The left panel depicts cells stained with a matched isotype control antibody. The dot plots derive from gated events of typical lymphocyte characteristics in forward and side light scatter. Flow cytometry was performed on a BD FACSVerse system.
