|                     | Background: Olfactory receptors interact with odorant molecules in the nose, to initiate a     |
|                     | neuronal response that triggers the perception of a smell. The olfactory receptor proteins are |
|                     | members of a large family of G-protein-coupled receptors (GPCR) arising from single coding-    |
|                     | exon genes. Olfactory receptors share a 7-transmembrane domain structure with many             |
|                     | neurotransmitter and hormone receptors and are responsible for the recognition and G protein-  |
|                     | mediated transduction of odorant signals. The olfactory receptor gene family is the largest in |
|                     | the genome. The nomenclature assigned to the olfactory receptor genes and proteins for this    |
|                     | organism is independent of other organisms. [provided by RefSeq, Jul 2008]                     |
