	MCFD2_MOUSE, Multiple coagulation factor deficiency protein 2, Neural stem cell derived	
	neuronal survival protein, Neural stem cell-derived neuronal survival protein, SDNSF.	
	Background: This gene encodes a soluble luminal protein with two calmodulin-like EF-hand	
	motifs at its C-terminus. This protein forms a complex with LAMN1 (lectin mannose binding	
	protein 1, also known as ERGIC-53) that facilitates the transport of coagulation factors V (FV)	
	and VIII (FVIII) from the endoplasmic reticulum to the Golgi apparatus via an endoplasmic	
	reticulum Golgi intermediate compartment (ERGIC). Mutations in this gene cause combined	
	deficiency of FV and FVIII (F5F8D), a rare autosomal recessive bleeding disorder characterized	
	by mild to moderate bleeding and coordinate reduction in plasma FV and FVIII levels. This	
	protein has also been shown to maintain stem cell potential in adult central nervous system	
	and is a marker for testicular germ cell tumors. The 3' UTR of this gene contains a transposon-	
	like human repeat element named 'THE 1'. A processed RNA pseudogene of this gene is on	
	chromosome 6p22.1. Alternative splicing results in multiple transcript variants encoding	
	distinct isoforms. [provided by RefSeq, Jun 2010]
