| Background: The ADP-ribosylation factor (ARF) protein family are structurally and functionally |
| conserved members of the Ras superfamily of regulatory GTP-binding proteins. ARFs influence |
| vesicle trafficking and signal transduction in eukaryotic cells. ARF6 plays a role in protein |
| trafficking near the plasma membrane, including receptor recycling, cell adhesion and cell |
| migration. ARF6 colocalizes with the ARF guanine nucleotide-exchange protein (GEP) BRAG2, |
| also designated GEP100. BRAG2 is ubiquitously expressed as two isoforms, BRAG2a and |
| BRAG2b, which can cycle between the cytoplasm and the nucleus. BRAG2, via its interaction |
| with ARF6, is involved in the regulation of cell adhesion by controlling Integrin 1 endocytosis |
| and E-cadherin redistribution. BRAG2 has also been shown to bind directly to Tyr1068/1086- |
| phosphorylated EGFR to activate ARF6, which induces tumor invasion in MCF7 cells. Therefore, |
| BRAG2 may contribute to the metastasis and malignancy of some breast cancer cells. |
