Background: This gene is a member of the DAZ gene family and is a candidate for the human Y-
chromosomal azoospermia factor (AZF). Its expression is restricted to premeiotic germ cells,
particularly in spermatogonia. It encodes an RNA-binding protein that is important for
spermatogenesis. Four copies of this gene are found on chromosome Y within palindromic
duplications, one pair of genes is part of the P2 palindrome and the second pair is part of the P1
palindrome. Each gene contains a 2.4 kb repeat including a 72-bp exon, called the DAZ repeat,
the number of DAZ repeats is variable and there are several variations in the sequence of the
DAZ repeat. Each copy of the gene also contains a 10.8 kb region that may be amplified, this
region includes five exons that encode an RNA recognition motif (RRM) domain. This gene
contains one copy of the 10.8 kb repeat. Alternative splicing results in multiple transcript
variants encoding different isoforms. [provided by RefSeq, Jul 2008]
