	1-like protein, Endoplasmic reticulum oxidoreductase alpha, Oxidoreductin-1-L-alpha, ERO1L
	Background: Oxidoreductase involved in disulfide bond formation in the endoplasmic reticulum.
	Efficiently reoxidizes P4HB/PDI, the enzyme catalyzing protein disulfide formation, in order to
	allow P4HB to sustain additional rounds of disulfide formation. Following P4HB reoxidation,
	passes its electrons to molecular oxygen via FAD, leading to the production of reactive oxygen
	species (ROS) in the cell. Required for the proper folding of immunoglobulins. Involved in the
	release of the unfolded cholera toxin from reduced P4HB/PDI in case of infection by V.cholerae,
	thereby playing a role in retrotranslocation of the toxin. Plays an important role in ER stress-
	induced, CHOP-dependent apoptosis by activating the inositol 1,4,5-trisphosphate receptor
	IP3R1.
Gene ID:	30001
UniProt:	Q96HE7
Pathways:	Peptide Hormone Metabolism, ER-Nucleus Signaling, Brown Fat Cell Differentiation
