|                     | Background: This gene encodes a mitochondrially-localized protein that has sequence similarity    |
|                     | to prokaryotic beta-lactamases. Many of the residues responsible for beta-lactamase activity      |
|                     | are not conserved in this protein, suggesting it may have a different enzymatic function.         |
|                     | Increased expression of the related mouse gene was found to be associated with obesity.           |
|                     | Alternative splicing results in multiple transcript variants encoding different protein isoforms. |
|                     | [provided by RefSeq, Dec 2013]  |
