	MCFD2_MOUSE, Multiple coagulation factor deficiency protein 2, Neural stem cell derived		
	neuronal survival protein, Neural stem cell-derived neuronal survival protein, SDNSF.		
	Background: This gene encodes a soluble luminal protein with two calmodulin-like EF-hand		
	motifs at its C-terminus. This protein forms a complex with LAMN1 (lectin mannose binding		
	protein 1, also known as ERGIC-53) that facilitates the transport of coagulation factors V (FV)		
	and VIII (FVIII) from the endoplasmic reticulum to the Golgi apparatus via an endoplasmic reticulum Golgi intermediate compartment (ERGIC). Mutations in this gene cause combined deficiency of FV and FVIII (F5F8D), a rare autosomal recessive bleeding disorder characterized		
	by mild to moderate bleeding and coordinate reduction in plasma FV and FVIII levels. This		
	protein has also been shown to maintain stem cell potential in adult central nervous system		
	and is a marker for testicular germ cell tumors. The 3' UTR of this gene contains a transposon-		
	like human repeat element named 'THE 1'. A processed RNA pseudogene of this gene is on		
	chromosome 6p22.1. Alternative splicing results in multiple transcript variants encoding		
	distinct isoforms. [provided by RefSeq, Jun 2010]
