	Background: PBR (Peripheral type Benzodiazepine Receptor) is a ubiquitous protein (18 kDa)
	found in most steroidogenic tissues. It is located primarily in the outer mitochondrial
	membrane of steroid producing tissues and is found in association with a 34 kDa voltage
	dependent anion channel protein (VDAC). PBR interacts with some benzodiazepines and has
	different affinities than its endogenous counterpart. PBR appears to be a key factor in the
	transport of cholesterol from the outer to the inner mitochondrial membrane to permit the
	initiation of steroid hormone synthesis. It is thought to be part of the mitochondrial permeability
	transition pore (PT) and to be involved in apoptosis. It is speculated that patients with
	congenital lipoid adrenal hyperplasia, who cannot make any steroids, might have a genetic
	lesion in BZRP. A short form, PBRS is also expressed in the same tissues, but at a level about
	ten times that of PBR.
