## Target Details

Background:	Synonyms: Checkpoint protein HUS1, hHUS1, HUS1 (S. pombe) checkpoint homolog, Hus1,
	HUS1 checkpoint homolog (S. pombe), HUS1 Checkpoint Protein, HUS1 protein, HUS1+ - like
	protein, HUS1_HUMAN, Hydroxyurea-sensitive 1, S. pombe, homolog of.
	Background: The protein encoded by this gene is a component of an evolutionarily conserved,
	genotoxin-activated checkpoint complex that is involved in the cell cycle arrest in response to
	DNA damage. This protein forms a heterotrimeric complex with checkpoint proteins RAD9 and
	RAD1. In response to DNA damage, the trimeric complex interacts with another protein
	complex consisting of checkpoint protein RAD17 and four small subunits of the replication
	factor C (RFC), which loads the combined complex onto the chromatin. The DNA damage
	induced chromatin binding has been shown to depend on the activation of the checkpoint
	kinase ATM, and is thought to be an early checkpoint signaling event. Alternative splicing
	results in multiple transcript variants. [provided by RefSeq, Feb 2011]
