Background:

Synonyms: Caspase-9 subunit p35, Apaf-3, APAF 3, APAF3, Apoptosis related cysteine peptidase, Apoptotic protease activating factor 3, Apoptotic protease MCH 6, Apoptotic protease MCH6, CASP 9, CASP9, Caspase 9, Caspase 9 apoptosis related cysteine protease, Caspase 9 precursor, Caspase 9c, Caspase9, Caspase9 subunit p10, ICE LAP6, ICE like apoptotic protease 6, RNCASP9, MCH 6, MCH6, OTTHUMP00000044594, CASP9_HUMAN. Background: Caspase 9 (also known as ICE like apoptotic protease 6 (ICE LAP6), apoptotic protease Mch6, and apoptotic protease activating factor 3 (Apaf3)) is a member of the peptidase family C14 that contains a CARD domain. This caspase is active as a heterotetramer and has been reported to have two isoforms. ProCaspase 9 has been reported to be approximately 47 kD. This caspase is present in the cytosol and, upon activation, translocates to the mitochondria. Caspase 9 is involved in the caspase activation cascade responsible for apoptosis execution and cleaves/activates Caspase 3 and Caspase 6. Caspase 9 is inhibited by the dominant negative isoform, BcIXL, cIAP1, cIAP2, XIAP, and Livin. This caspase becomes activated when recruited to Apaf1/cytochrome c complex, and following cleavage by Apaf1, granzyme B, Caspase 3, possibly Caspase 8 and Caspase 10 into large p37 and small p10 subunits. Caspase 9 intereacts with BIRC7 and has been shown to cleave PARP and vimentin.?
