#### Target Details

Background:	Synonyms: CNTFR Alpha, Ciliary neurotrophic factor receptor alpha, CNTFR Alpha, CNTFR,
	Ciliary neurotrophic factor receptor alpha, Ciliary neurotrophic factor receptor subunit alpha,
	CNTF receptor subunit alpha, CNTFR Alpha, CNTFR, CNTFR-alpha, CNTFR.
	Background: This gene encodes a member of the type 1 cytokine receptor family. The encoded
	protein is the ligand-specific component of a tripartite receptor for ciliary neurotrophic factor,
	which plays a critical role in neuronal cell survival, differentiation and gene expression. Binding
	of ciliary neurotrophic factor to the encoded protein recruits the transmembrane components
	of the receptor, gp130 and leukemia inhibitory factor receptor, facilitating signal transduction.
	Single nucleotide polymorphisms in this gene may be associated with variations in muscle
	strength, as well as early onset of eating disorders. Alternatively spliced transcript variants have
	been observed for this gene. [provided by RefSeq, May 2011].
