Keratinocyte growth factor-regulated gene 2 protein, KRG 2, KRG-2, KRG2, Probable ATP
dependent RNA helicase DDX11, Probable ATP-dependent RNA helicase DDX11.
Background: DEAD box proteins, characterized by the conserved motif Asp-Glu-Ala-Asp (DEAD),
are putative RNA helicases. They are implicated in a number of cellular processes involving
alteration of RNA secondary structure such as translation initiation, nuclear and mitochondrial
splicing, and ribosome and spliceosome assembly. Based on their distribution patterns, some
members of this family are believed to be involved in embryogenesis, spermatogenesis, and
cellular growth and division. This gene encodes a DEAD box protein, which is an enzyme that
possesses both ATPase and DNA helicase activities. This gene is a homolog of the yeast CHL1
gene, and may function to maintain chromosome transmission fidelity and genome stability.
Alternative splicing results in multiple transcript variants encoding distinct isoforms. [provided
