Target Details	
Background:	Synonyms: proinsulin precursor, Hyperproinsulinemia, INS, Insulin Precursor, IRDN, Proinsulin,
	Propeptide, C-Peptide, INS2_MOUSE.
	Background: C Peptide is part of the molecule of Proinsulin, that consists of three parts: C
	Peptide and two long strands of amino acids (called the alpha and beta chains) that later
	become linked together to form the insulin molecule. From every molecule of proinsulin, one
	molecule of insulin plus one molecule of C Peptide are produced. C peptide is released into the
	blood stream in equal amounts to insulin. A test of C peptide levels will show how much insulin
	the body is making. Insulin decreases blood glucose concentration. It increases cell
	permeability to monosaccharides, amino acids and fatty acids. It accelerates glycolysis, the
	pentose phosphate cycle, and glycogen synthesis in liver.
