PROTEIN GCS1.
Background: The ADP-ribosylation factor (ARF) family of small GTP-binding proteins are
involved in vesicular transport regulation and in controlling cytoskeletal organization and cell
adhesion. These proteins mainly regulate membrane traffic. ACAP2 is a member of the
centaurin GTPase-activating protein (GAP) family, which comprises a subset of ARF regulatory
molecules that transduce PI 3-kinase activation into coordinated control of ARF-dependent
pathways. ACAP1 and ACAP2 are both widely expressed in peripheral, tubular membranes and
usually interact with each other in various tissues. GAP activity of both ACAP1 and ACAP2 is
dependent upon phosphatidylinositol 4,5-bisphosphate [PtdIns(4,5)P2]. ACAP2 associates with
ARF1 and ARF6. Overexpression of ACAP2 blocks the formation of ARF6-dependent
protrusions. K1L is a protein required for growth of the Vaccinia Virus that interacts with the
ankyrin repeats of ACAP2.
